Comprehensive report on the Montenegrin waste management and water sectors published

The country profile authored by Andreas von Schoenberg Consulting and Burghard International Business Development contains a wealth of information on the solid waste management, water supply and waste water treatment sectors in Montenegro. Moreover, the report outlines business opportunities for engineering and service companies planning activities in these sectors and contains helpful tips on possible market entry routes. The report was presented at a conference at the German Environment Ministry on 8th June.

Although Montenegro is one of Europe's smaller countries, it is an attractive market for suppliers of waste, water and waste water management services and products. Over the last few years Montenegro has invested considerable funds in developing its waste and water management infrastructure – partly in order to bring its environmental standards in line with those of the EU and partly to enhance its appeal for the growing number of tourists visiting the country. This trend is expected to continue over the coming years.

For these reasons a detailed analysis of the waste and water sectors in Montenegro was commissioned as part of the 'Export Initiative Environmental Technology' funded by the Federal Ministry for the Environment, Nature Conservation, Building and Nuclear Safety.

The report is available in German under the following link:
